Sampling, Weighting and Estimation Exercise 1

Stefan Zins, Matthias Sand and Jan-Philipp Kolb

GESIS - Leibniz Institute for the Social Sciences

January 29, 2016

Exercise 1

Download the ESS dataset for Sweden (Sampling Data and Country File) of the 5th round

```
http://www.europeansocialsurvey.org/data/country.
html?c=sweden
```

- Setup your workspace and load the R-packages foreign and survey
- 3 Load the ESS dataset and the country file
- 4 Merge both data frames by their ID-variable, using the merge()-command

Exercise 1

- 5 Determine the sampling strategy (Inspect the variables SAMPPOIN,STRATFY and PROB)
- 6 Add the variable N = dweight * pweight * 10000 * n to your data frame that equals the total population size for the target population of the ESS Round 5 of Sweden
- Convert your data frame to a survey object (survey-Package)
- 8 Estimate the total and mean of the variable tytot

THE survey-PACKAGE

- The survey package provides a large range of applications for complex survey samples
- Typically, the first step is to define a survey object with the svydesign() command

Simple survey object (Simple Random Sample)

```
data(api)
surv.obj <- svydesign(id=~1,fpc = ~fpc, data = apisrs)</pre>
```

THE SURVEY PACKAGE

```
surv.obj <- svydesign(id=~1,fpc = ~fpc, data = apisrs)</pre>
```

- id specifies the identifier of PSU and SSU;id= ~0 or id=~1 stipulates a single stage sampling
- For multi-stage samples the id argument should always specify a formula with the cluster-identifier at each stage
- fpc should be used for the finite population correction
- ⇒ Either as the total population size of each stratum or as a fraction of the total population that has been sampled
 - data reflects the data set for which the design object should be defined

Important commands

svytotal returns the estimated total of a variable

and its standard error (+deff)

svymean returns the estimated mean of a variable

and its standard error (+deff)

svyquantileComputes quantiles for data from complex surveyssvyvarComputes variances for data from complex surveysweightsReturns the (design) weights of a survey objectcalibrateCalibration of a data set (uses the GREG-Estimator)

...

```
svytotal(~api00,surv.obj)

## total SE
## api00 4066888 57293
```
